

Disruptive enclaves and risky politics. The challenges of making mining work for sustainable development

Views from several H2020 projects

Piet Wostyn

Antwerp, 26 November 2019

Can mining stimulate sustainable development?

It depends...

- What kind of mining?
 - What for?
- **Management of impact of mining and minerals processing**
 - Economic
 - Social
 - Environmental
 - Political and cultural

Overview

- Context
 - Demand for resources
 - Recycling
 - Mining: past, present and future
- Challenges of governance of mining
- Social License to Operate
- Final thoughts

Context

Demand for resources
Mining vs recycling

Present and future of mining

- Mineral resources extraction has increased at a **faster rate than economic growth**.
- Extractive sector could **struggle to meet demand** over next 2-3 decades for several minerals for which substitutes not readily available.
- Risk of **price volatility** that could hamper efforts to deliver enduring benefits for resource-rich countries, coupled with **environmental and social risks**.

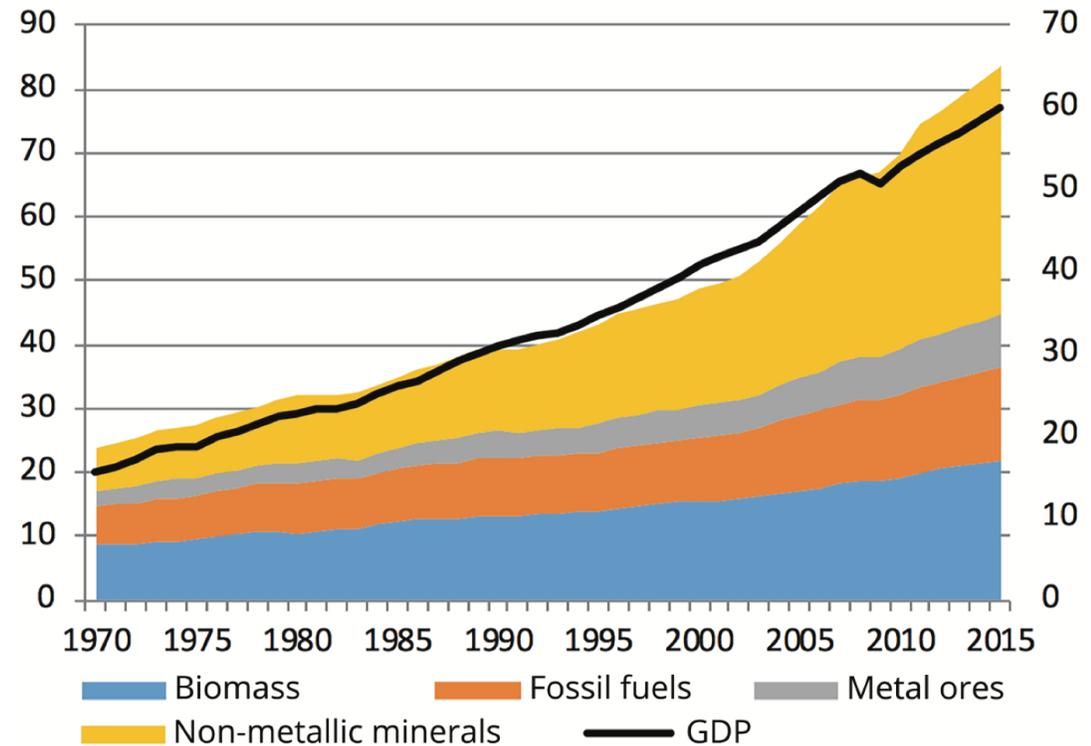

Figure 1: Global material extraction in billion tonnes (LEFT SCALE), global GDP (RIGHT SCALE) in trillion US dollars¹

Source: IRP 2017 - Resource Efficiency

Context

Increasing need for materials

- **Consumerism, capitalism**
- **Transition** to a low-carbon economy
- **Low recycling efficiencies**, especially for Critical Raw Materials (CRM).
- Even 100% **recycling** cannot address the current* *need* for (a lot of) primary mining

http://www.ceeweb.org/wp-content/uploads/2012/03/RCC_policy_document_20131.pdf

A parenthesis about recycling

- Recycling efficiency is increasing but still low
- Technological advances and barriers
- Process economics (recycling vs landfill)
- Material losses & exergy
- Design for recycling
- Product cycle & end of life
- Waste collection & transport
- Recycling vs reuse vs repair.

⇒ Is **circular economy** a myth?

Mining

- **Bad reputation:** ‘dirty business’.
- Highly diverse sector
- Mining heritage
- (‘Highly publicized’) accidents (e.g. Brumadinho)

>< The industry is desperately trying to convince the public they have improved. New discourse: link to renewable energy and societal benefits.

⇒ Is the mining sector in denial?
 Precautionary principle? (too) large scale impact?

Created by Gan Khoon Lay from Noun Project

Cobre las Cruces (Sevilla, Spain)

Has the 'mining sector' changed?

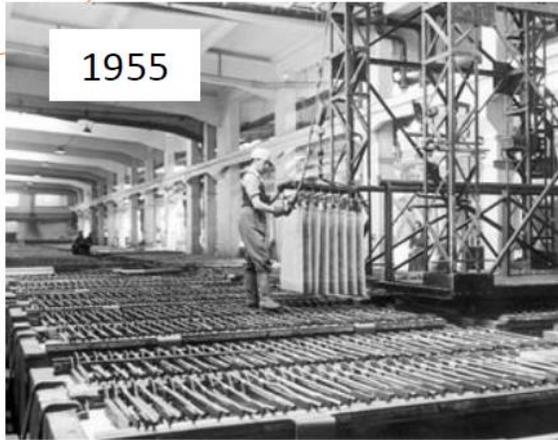

'Mining' is a highly diverse sector!!

Mining	Past	Future
Goal	Profit making (e.g. gold)	Resources for applications
Owner	Mining company itself	Shareholders; large groups aim to control the value chain
Operations	One company, A-Z	Various subcontractors Multiple stakeholders
Resources	Reachable, higher % in the 'simple' ores	Difficult access, low(er) grade and complex ores; more varied elements
Scale	Underground, local artisanal mining to open pit	Super open pits; mixed
Opex – capex	Labour intensive	Capital intensive
	# years from exploration to exploitation has increased; In EU, the process has generally become more bureaucratic	

Has the mining sector changed?

- Increased efficiencies, but slow and costly process? Innovation vs risk averse?

Copper tankhouse

1955

- small cells (440)
- Starting sheets
- Cathode harvesting with current off
- Cast Pb-Sb anodes

2014

- High energy consumption
- Escalating costs
- Operational & HSEC challenges

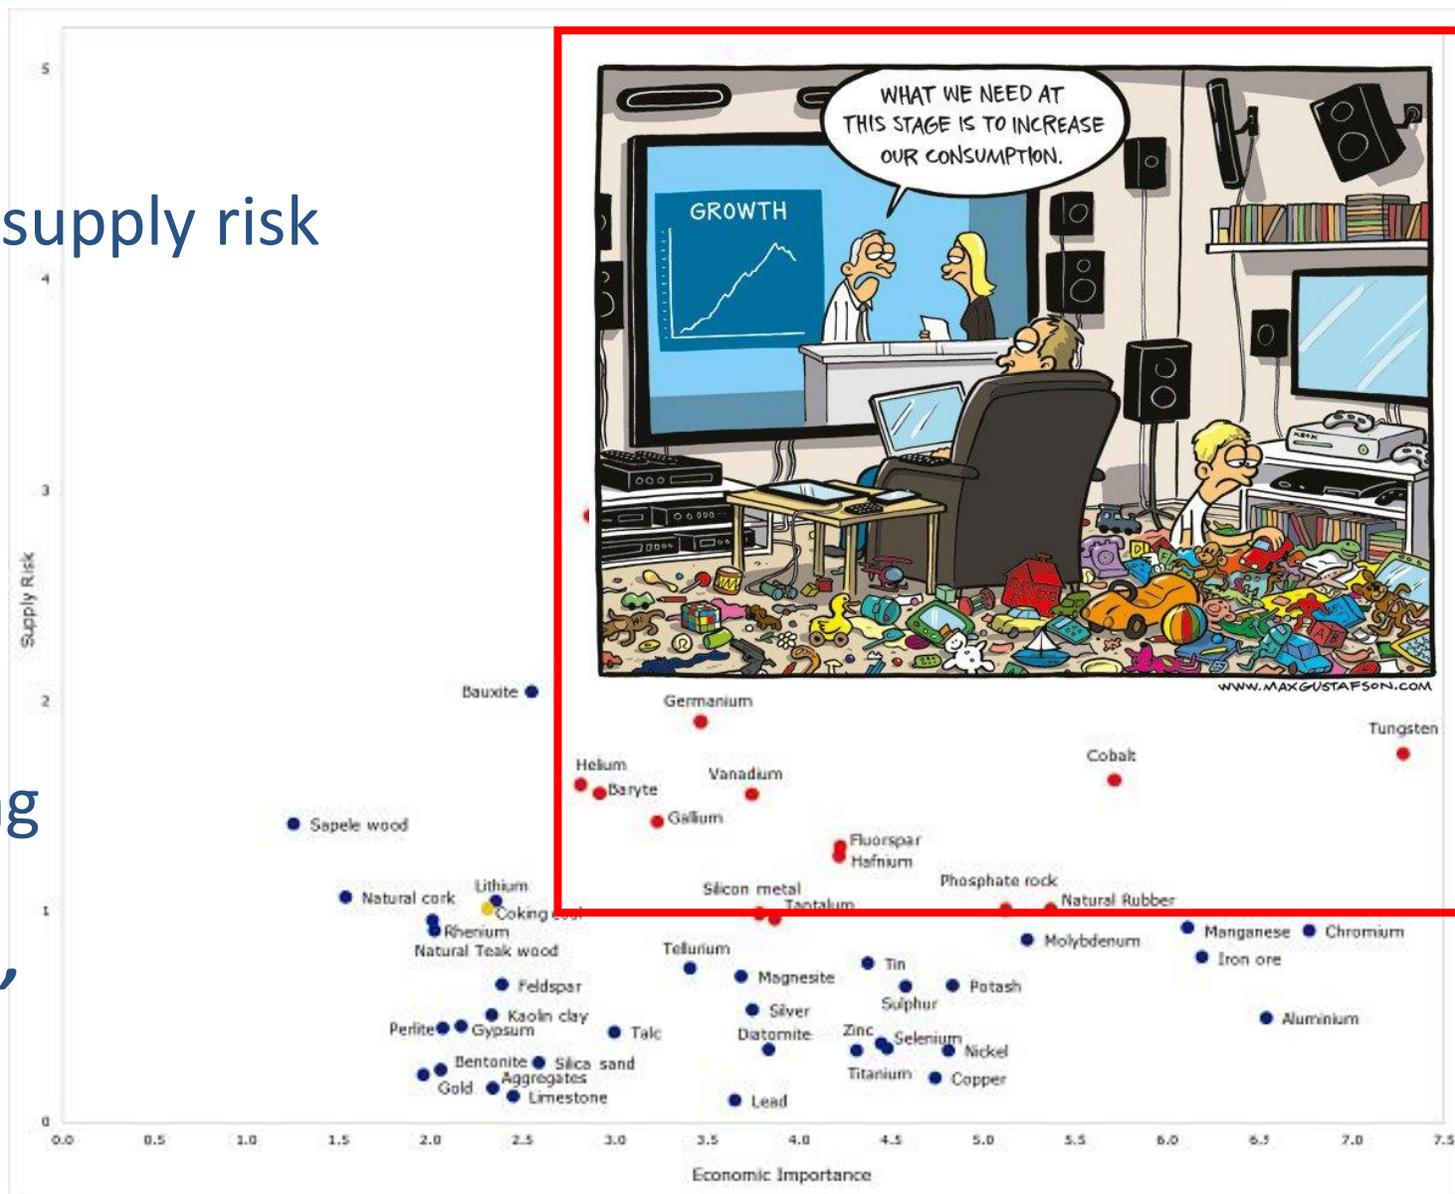

European context

- **Critical Raw Materials list**
 - Economic importance x supply risk

- Import vs mining in EU?

- EC calls for strategies to **engage civil society to build trust** in the EU mining and recycling sector:

⇒ ***'Social License to Operate'***

Governance challenges of mining

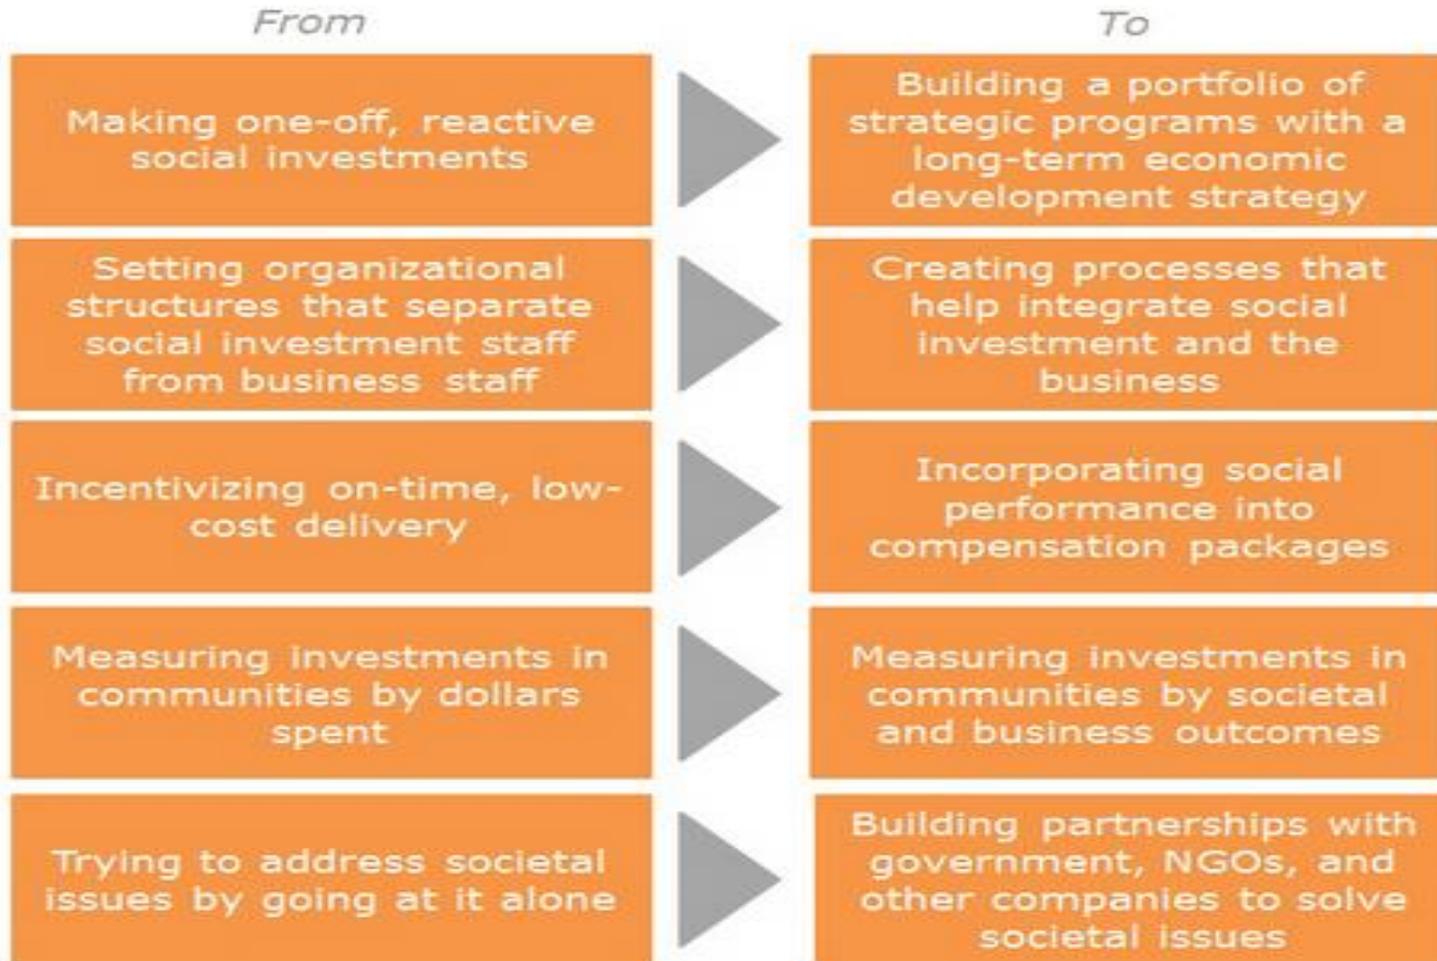

Governance challenges of mining

- Negative and **enduring impacts** of mining: environmental, social, economic, cultural and political.
- **Uneven distribution** and **finite nature** of mineral resources, feeding geo-political risks.
- **Enclaved** nature of the mining sector in many countries.
- **Volatility** of commodity prices, macro-economic effects.
- Difficulty of managing large and **volatile capital inflows**.
- **Information and power asymmetries** between governments and companies, technical complexities of large-scale projects.
- **Lack of accountability and transparency**.

The way forward?

Companies in the extractives sectors can adjust their approach to societal issues.

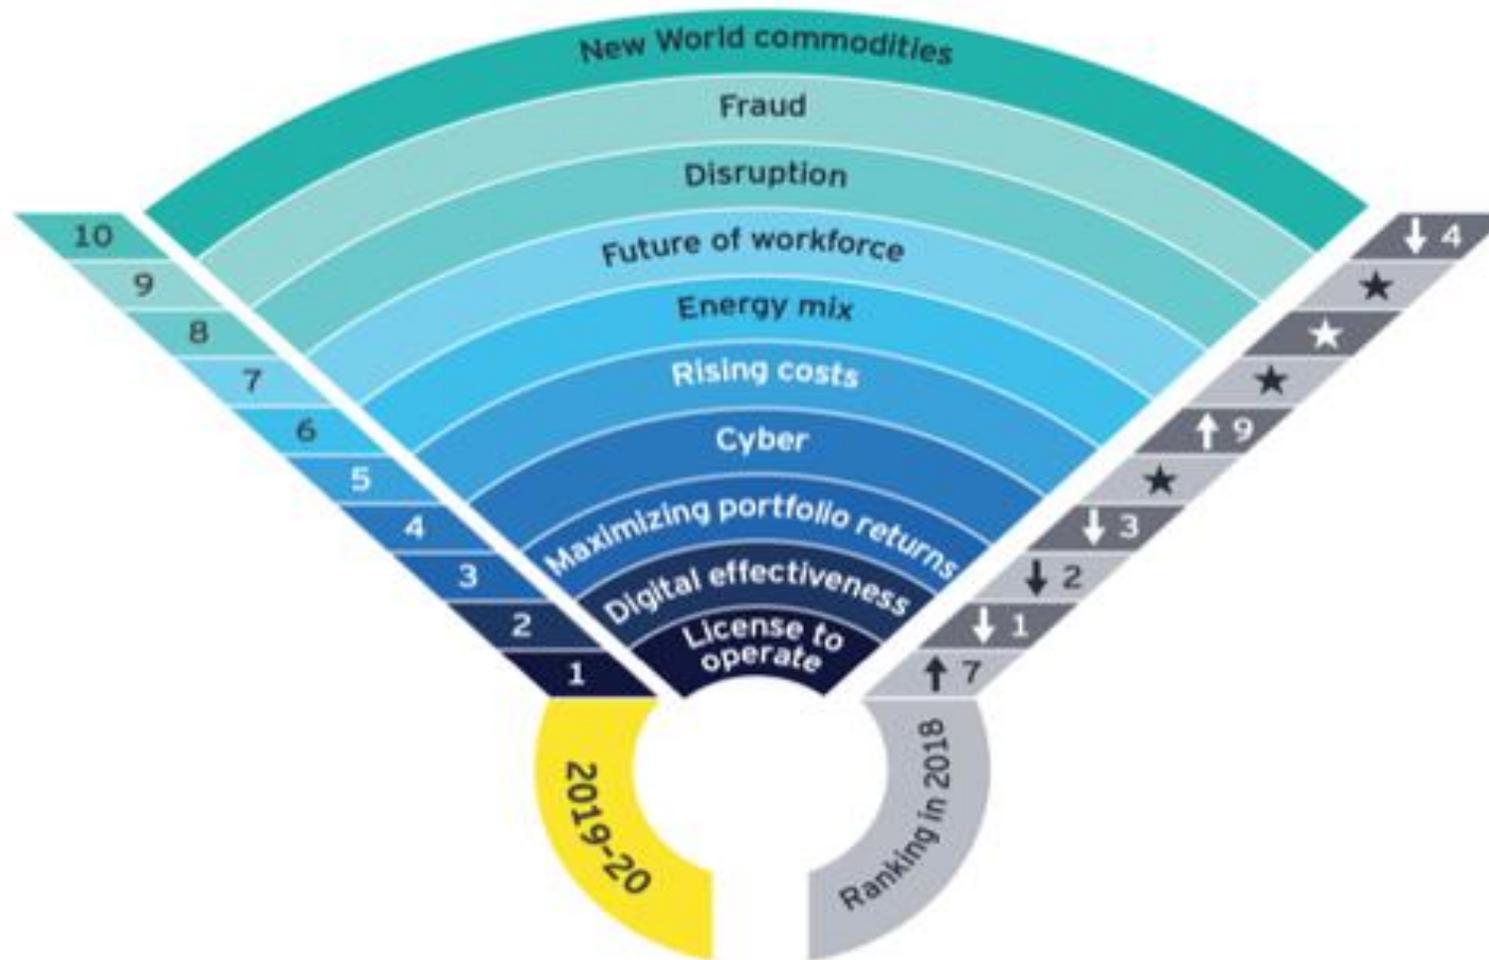

sharedvalue.org/extractives

Governance of mining today

- UNEP IRP: “*Growing recognition that a well-managed mining sector can **potentially** support wide range of development outcomes across the SDGs*” (e.g. Development Minerals Programme)
- Variety of **governance frameworks and instruments** at multiple scales that seek to reinforce the social, environmental and economic outcomes of mining: e.g. Africa Mining Vision, EITI, GRI, Model Mining Development Agreement, IRMA, Natural Resource Charter, ICMM, etc.
 - >< represent only piecemeal efforts
 - >< often fail to be implemented at the national level
- ‘**Social License to Operate**’ (SLO) processes are more commonly used to secure consent and involvement of local community stakeholders.
 - EY considered SLO the **#1 business risk** in 2019-2020

License to Operate as a 'business risk'

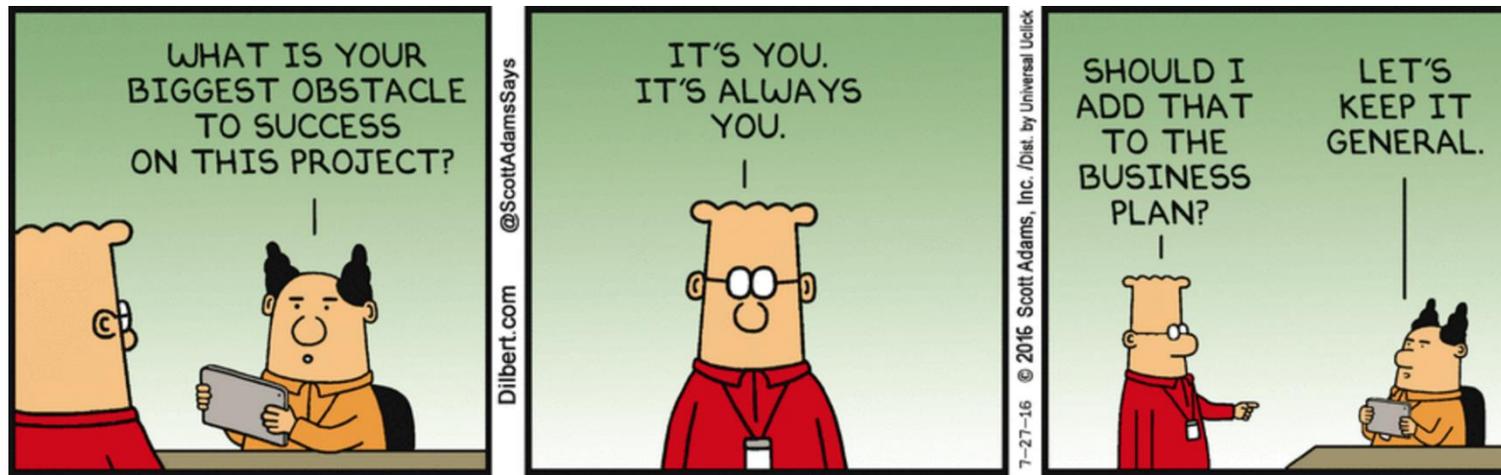

Top 10 business risks

↑ Up from 2018 ↓ Down from 2018 — Same as 2018 ★ New to the radar

From CSR to Social License to Operate

Green washing or a true opportunity?

Social License to Operate

- '90s: bad reputation + increasing **cost of conflict**: poor environmental practices => social perception and reputation => financial performance.
- Jim Cooney: “Social License to Operate”: **desire to control** the relationship with project stakeholders (e.g. reputation management, information gathering and provision, strategic planning tools).
- Range from voluntary governance schemes (CSR?) to legally binding.
- Perceived overlap with the impact assessment (EIA public consultation)
- 2000s onwards: SLO expands: energy, agriculture, forestry, paper industry, etc.

Social License to Operate

• Definition: *“the ongoing acceptance and/or approval of an industrial activity by a set of relevant stakeholders”*

- Acceptance? Approval? Permission?
- Granted by who?
- How/Who can revoke?

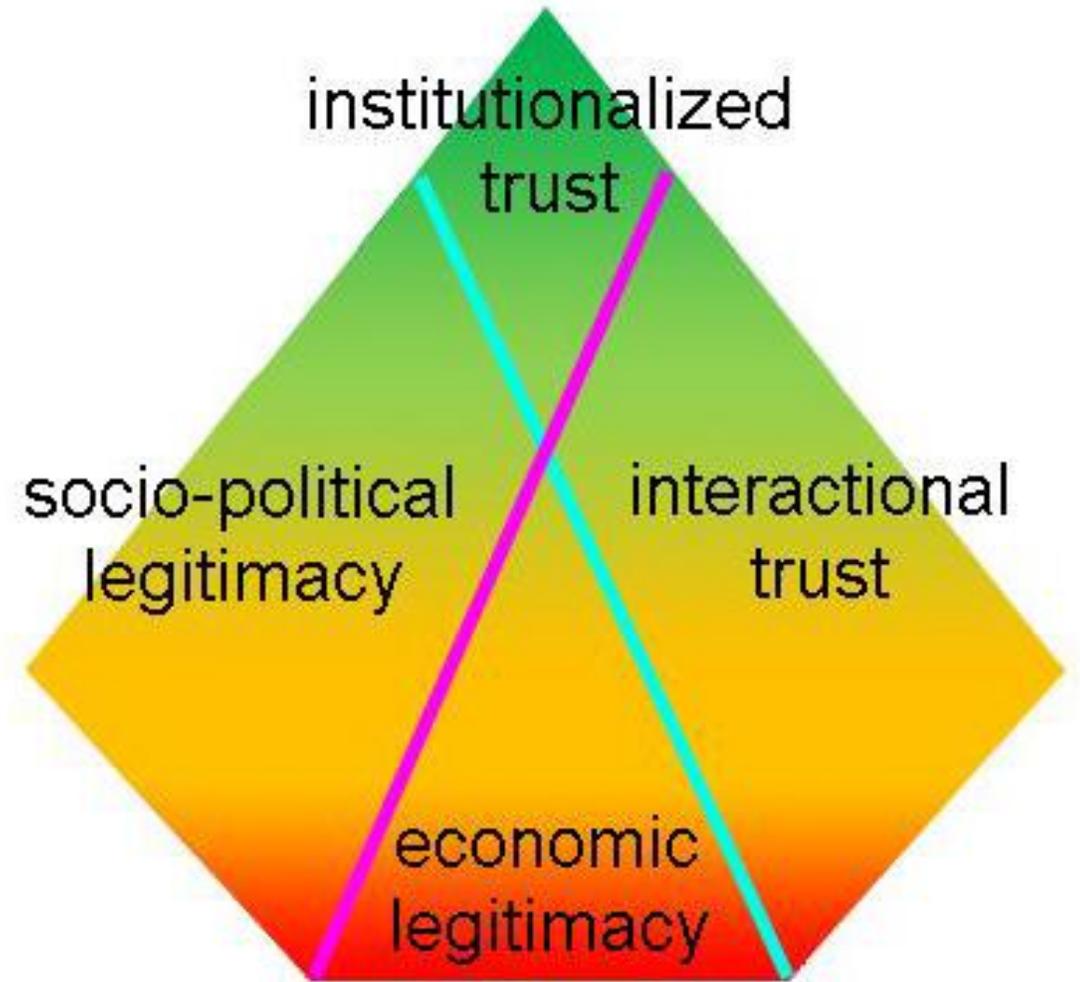

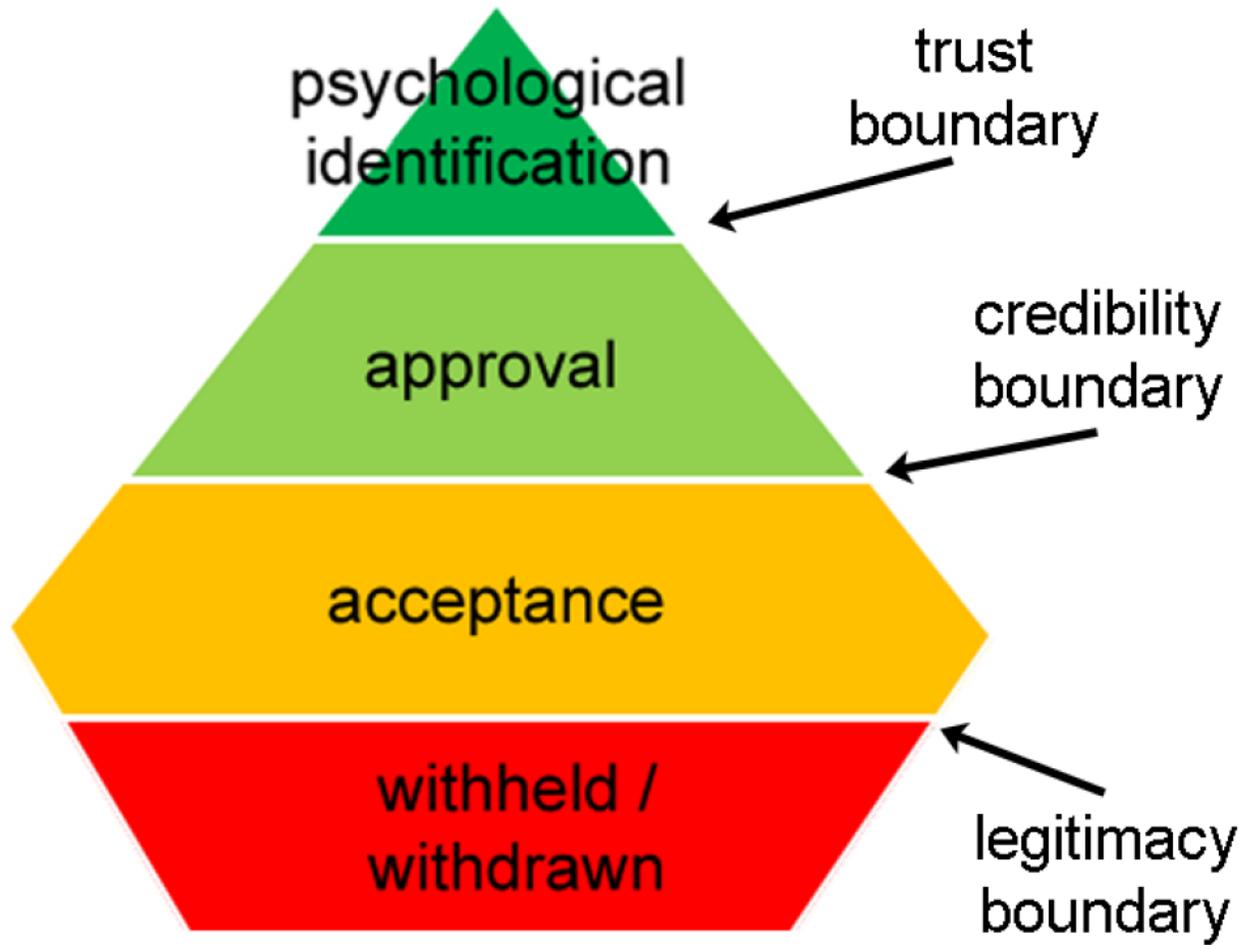

⇒ Metaphor, ‘soft law’: the **level of ‘acceptance’** that companies receive from local communities, broader society and public bodies.

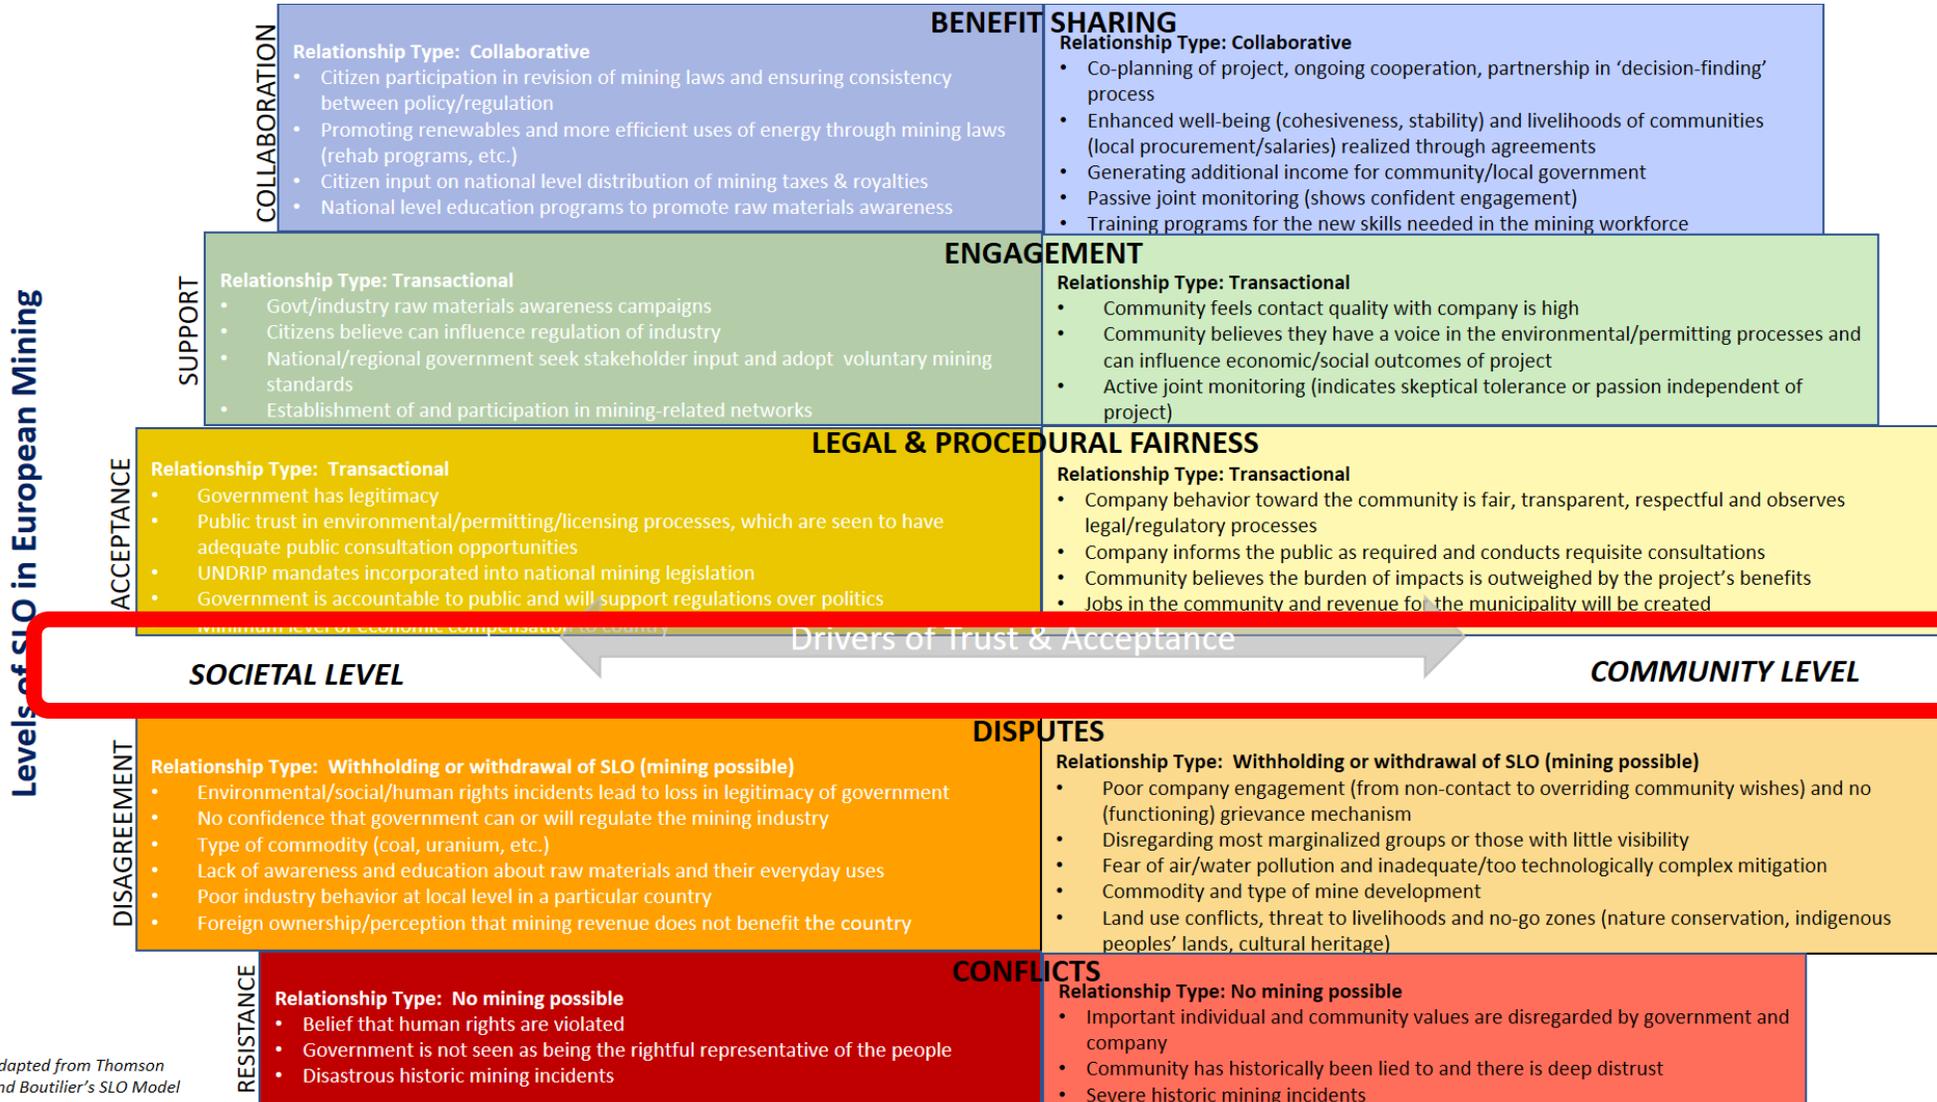

Social License to Operate

- **Inclusive** concept; depends on **relationships**: local communities and **participation** of civil society in the management and regulation of natural resource exploitation.
- Rooted in the **beliefs and perceptions** a local community and other stakeholders.
 - Trust, confidence, knowledge; demands and expectations; dependence on operations?
- SLO reviews performance of company + involvement of citizens in decision making
- **Dynamic** and changing reflection of the quality and strength of the **relationship** between an industry and a community of stakeholders.

SLO Models

SLO Models

Adapted from Thomson and Boutilier's SLO Model

Review SLO literature

- Focus on 'S'
 - >< often ignores diversity within 'local community'
 - >< but S includes/implies economic, environmental, cultural, political impact
- Confusion about 'L': it is a relationship, not a 'license'
- **Little consideration of 'O'**
- (UNEP IRP: towards '*Sustainable Development License to Operate*'?)

Critique on SLO

- Leida Rijnhout: *“empty-container concept, which is too voluntaristic and is prone to greenwashing activities by international mining co-operations.”*
- Meesters: *“SLO is too ambiguous; its translation 'in the field' remains problematic.”*

In **Global South**: SLO influenced by power relations and democratic structures (=> “the poor sell cheap”).

<> In **Western context**: strong(er) democratic structures; highly organized civil society. The SLO concept might be more relevant in an EU mining context?

SLO in practice

- ~Example: Community Development Agreements

- Extremely sensitive

- Confusing SLO vs awareness raising

- Product vs process

- Willingness for a long term dialogue? Who is at the table?
CSO vs NGO vs industry? Common ground for dialogue?

- *“The industry needs the resources from the territory of a local community... more than the local community needs the industry.”*

Case study - SLO in Belgium

- Constructive interaction between company, researchers and local community
 - Long term process: the trust of the local communities has steadily grown.
- ⇒ The ‘De Locals’ group co-designs and co-implements the project + bridge to community.

But dialogue is not enough!?

⇔ A small group of people continues to resist the project.

CSR vs SLO

- Whose business? Which stakeholders/shareholders?
- Can SLO evolve from **risk management** towards **value creation**?
Towards a pro-active stakeholder engagement?
- A quieter processes of negotiation, persuasion, manipulation and seduction?
Or
A true opening for mining companies to stimulate locally based, comprehensive **sustainable development**?

Final thoughts

- Sustainable development needs ~~mining~~ (*resources*)
 - Transition to low-carbon economy <> Climate breakdown
- Governance issues of primary mining
- Opportunities of Social License to Operate?
- The **way** mining is done is not questioned (enough)

⇒ Sustainable development needs...

- Less demand for materials
- More re-use, repair and recycling +truly circular economy
- System change, degrowth & stakeholder dialogue
